

WARNING!

EURASIAN WATER MILFOIL

PLEASE HELP US STOP THE SPREAD OF THIS VERY DAMAGING WEED IN SOUTH LAKE

Weeds torn by boat propellers or other human activity will propagate quickly into a thick mass of tangled stems underwater and mats of vegetation on the water surface of the lake.

Dense mats of Eurasian Water Milfoil block light from penetrating into the water which shades out other aquatic vegetation. This aggressive growth kills off

other plant life and adversely effects the natural ecosystem of South Lake. Stands of the plant create stagnant water and create ideal breeding grounds for mosquitoes.

The plant poses a problem to human recreational activities such as swimming, boating and fishing. The weeds often bind up motor propellers and get caught in rudders and paddles.

Two primary Milfoil sites exist in South Lake (one at the north end and one along the east shore across from the trailer park) and are depicted on the map. Five smaller sites around the lake have also been discovered.

Please stay out of these and any EURASIAN WATER MILFOIL stands you may find.
